EXECUTIVE SUMMARY

Colorado Department of Transportation (CDOT) contracted with Atélior, LLC to conduct a comprehensive state of seat belt usage in June 2022. This report highlights the findings of this study.

Atélior Research Team:

D. Todd Donovan, PhD	Principle Investigator
Jon Schroth	Project Coordinator
Tom Petersen	Administration /Oversight
Richard Motzkus	Field Administration
Todd Tuell	Lead Statistician

Atélior hires retired Colorado State Highway Patrol Officers to serve as observers. This benefits the project as these individuals have a keen understanding of safety procedures and are familiar with the interstate, state highway, local and country roads. Additionally, many of these individuals have worked on this study for several years so they have a wealth of knowledge to apply to the work. Their experience both in their past profession and in this study strengthens the reliability and validity of our results.

To assure the results are at the highest standards of reliability and validity, Atélior retrains the observers on the proper procedures of observation and recording each year. Additionally, observers are evaluated in the field to assure their accuracy. This is the third year of using iPads for data collection which enhances the validity of the data.

A total of 744 sites were surveyed, with a total of 99,476 vehicles surveyed during the study. The observers documented 120,758 occupants of the vehicles which include both driver and front seat passengers. The results are organized across five vehicle categories of cars, vans, sports utility vehicles (SUVs), pickup trucks, and commercial vehicles (10,000 pounds or less). This is the first year of five to utilize new site locations. Observations involved 26 counties across the state of Colorado. The results demonstrate an overall seat belt usage rate of 87% across the five vehicle categories.

D. Todd Donovan, PhD
Principle Investigator, Atélior

Seatbelt Usage Across the Five Vehicle Categories

The 2022 Colorado Statewide seat-belt survey is provided in Table 1.0 below. The five vehicle categories from highest to lowest in seat-belt usage are as follows: **SUVs** 90.3% (C.I. 89.0% to 91.5%), **Vans** 89.0% (C.I. 86.5% to 91.5%), **Cars** 87.6% (C.I. 86.0% to 89.1%), **Commercial Vehicles** 79.2% (C.I. 76.2% to 82.3%), and **Trucks** 78.5% (C.I. 76.7% to 80.4%).

The overall rate across all vehicle types stands at 87.0% (C.I. 85.8% to 88.2%). The confidence interval (C.I.) indicates that we are 95% confident that the overall rate, if we took a large number of samples, would be between 85.8% and 88.2%. The confidence interval compares nicely with last year's statewide study. Last year's confidence stood at 85.4% to 87.7%, hence both the upper and lower bounds of the confidence interval moved slightly upward.

Table 1.0

2022 Statewide Seat-belt Usage by Vehicle Type

	# of Sites	Estimate %	Std Error	CV %	Lower 95% Limit	Upper 95% Limit
Cars	744	87.6	0.8	0.90	86.0	89.1
Vans	744	89.0	1.3	1.44	86.5	91.5
SUVs	744	90.3	0.6	0.71	89.0	91.5
Trucks	744	78.5	0.9	1.19	76.7	80.4
Commercial	744	79.2	1.6	1.96	76.2	82.3
Overall	744	87.0	0.6	0.70	85.8	88.2

Statewide Seatbelt Survey

Sampling Methodology

There were 744 statewide sites chosen from 26 counties for the seat belt survey with 738 original sites and 6 alternate sites providing survey data for this study performed during a 2-week period in June 2022. In selecting the sample, stratification by county was employed as well as an unequal weighting by road class. Each county had either 12 or 48 sites chosen for observations.

**11 of the 744 Statewide survey sites produced ZERO observations.*

Analysis Methodology

Driver and passenger observation data was combined with site characteristic data to create the input data file. Sampling weights were derived and utilized in the analysis.

The R Survey package was utilized to analyze the observation data. The overall usage estimate (percentage) and usage estimates by vehicle type were calculated using the svratio function. For the usage estimates by the various domains (vehicle speed, road class, and county) the svyby function was used. Both the svratio and svyby functions take into account the design used in selecting the sample. The cv and coef functions were employed to calculate the coefficients of variation and 95% confidence interval limits for the estimates.

Sample Characteristics

- 744 of 744 sites surveyed.
- 99,476 vehicles were surveyed
- 120,758 occupants (both drivers and front seat passengers) were surveyed
- 3,125 occupants were surveyed as “unable to be observed” (2,890 of these were drivers)
 - This represents 2.6% of all individuals surveyed (observable + non-observable)
 - Non-observable rates by vehicle type

Vehicle Type	2022	2021	2020
Car	2.5%	2.1%	2.8%
Van	1.3%	0.8%	1.1%
SUV	4.1%	2.2%	2.3%
Truck	2.1%	2.1%	4.9%
Commercial	2.1%	2.1%	2.0%
Overall	2.6%	2.0%	2.9%

RESULTS

Statewide Survey Results

We found consistent results in the 2022 statewide survey compared to the 2021 study. In 2021, we found an overall rate of 86.6% with an overall rate of 87.0% in 2022. This demonstrates a modest increase of .4% and a percentage increase of .46% $((87.0-86.6)/86.6)$. The 2022 rate of 87.0% is in line with the five-year moving average of 86.9%. This compares nicely to the previous five years, 2013 to 2017, when the seat belt usage rate averaged 83.5%. The current rate of 87.0% represents a 4.2% increase over the 2013 to 2017 time period.

There were some changes in the vehicle categories, most notably, **Trucks** dropped from 88.1% in 2021 to 78.5% in 2022. We found a **Trucks** rate of 80.5% in this year's pre-mobilization study. Hence, the 78.5% rate is in line with recent observations. Additionally, as Table 2.0 demonstrates, the current **Trucks** rate is more in line with previous studies from 2018 to 2020 when **Trucks** averaged 80.33% over that three-year period.

The other vehicle categories exhibit minor changes as follows: **Cars** increased by .6 for a percentage increase of .69%, **Vans** increased by .9 with a percentage increase of 1.0%, **SUVs** increased by 4.4 (5 percent increase), and **Commercial Vehicles** increased by 3.0 (3.9 percent increase).

Table 2.0
Historical Statewide Usage Rates (%)

	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022
Car	82.6	83.1	85.2	83.9	83.7	86.0	88.3	86.1	87.0	87.6
Van	86.9	87.3	89.2	89.5	87.2	88.0	90.1	90.2	88.1	89.0
SUV	86.7	87.1	89.9	89.2	88.5	90.8	92.0	90.9	85.9	90.3
Truck	73.0	72.4	77.6	76.1	76.5	80.1	82.6	78.3	88.1	78.5
Commercial	65.5	67.5	73.9	68.2	70.8	74.7	75.8	74.8	76.2	79.2
Total	82.1	82.4	85.2	84.0	83.8	86.3	88.3	86.3	86.6	87.0

Comparing Statewide and Premobilization Results

This overall Statewide usage rate is slightly above the usage rate found in May during our premobilization study. The overall premobilization rate stood at 86.4% (C.I. % 84.2% to 88.7%), with the Statewide standing at 87% (C.I. 85.8% to 88.2%). Two categories decreased in the Statewide study from the premobilization: Trucks dropped by 2.0% to 78.5% and commercial vehicles dropped by 4.6% to land at 79.2%. The other three categories increased since the premobilization study: Cars increased by 1.5%, Vans increased by 7.4%, and SUVs increased slightly by .6%. Overall, there is a small increase in seat belt usage since the premobilization study in May.

While we only find a small increase over the premobilization numbers, we should consider the long-term impact of running the “Click-It-Or-Ticket” campaign. Research demonstrates that the long-term effect of exposure to campaigns has a positive impact on occupant’s behavior. That is, occupants are more likely to wear their seat belts because they were exposed to a “reminding” campaign over and over again in previous years.

Table 3.0
Seat Belt Usage Comparison Between 2022
Premobilization and Statewide Study

Vehicle Type	Premobilization Results	Statewide Results	Change	% Change
Car	86.1%	87.6%	1.5%	1.7%
Van	81.6%	89.0%	7.4%	9%
SUV	89.7%	90.3%	.6%	.67%
Truck	80.5%	78.5%	-2.0%	-2.5%
Commercial	83.8%	79.2%	-4.6%	-5.5%
Overall	86.4%	87.0%	.6%	.69%

Seat-belt Usage Since 2013

Table 4.0 captures the absolute increases in each vehicle category as well as the percentage increase since 2013. All five vehicle categories increased over the past nine years. The highest increases came in **Commercial Vehicles** (13.7% increase) and a percentage increase since 2013 of 21.0%. **Trucks** increased by 5.5% for a percentage increase of 7.5% over the last nine years. Overall, seat-belt usage increased across all five vehicle categories by 4.9% since 2013.

Table 4.0
Increases in Seat-belt Usage in Past Nine Years (%)

Vehicle Type	Absolute Increase	Percentage Increase (2013 to 2022)
Car	5.0	6.0%
Van	2.1	2.4%
SUV	3.6	4.2%
Truck	5.5	7.5%
Commercial	13.7	21.0%
Overall	4.9	5.97%

Seat-belt Usage by Passengers

For the past two years, we've presented the data on front-seat passenger seat belt usage. Table 5.0 below demonstrates a slight increase in front-seat passenger usage over the 2021 data. Overall, passengers wore their seat belts 87.57% of the time in 2021 and 89.72% in 2022. This represents an increase of 2.15 and a percentage increase of 2.45%, $((89.72-87.57)/87.57)$. The Trucks category was the only category where the rate of seat belt usage dropped for passengers in 2022. Truck passengers dropped from 88.41% to 82.05% in 2022, a drop of 6.36 (7.1 percentage decrease).

Table 5.0
Statewide Passenger Usage Rate by Vehicle Type

Vehicle Type	2021	2022
Car	85.56	88.20
Van	93.13	99.17
SUV	88.38	92.88
Truck	88.41	82.05
Commercial	72.33	74.64
Overall	87.57%	89.72%

Seat-belt Usage and Speed

Atélior analyzed the seat belt usage rate based on the speed of vehicles traveling. The actual speed of each vehicle is not captured. However, observers document the speed limit within the area observed. Table 6.0 presents the data of the three categories of *0-30*, *31-50*, and *Greater than 50* miles per hour. As found in previous studies, seat belts are more likely to be worn when driving at higher speeds. Seat belt usage was the highest among vehicles traveling above *50 mph*. The estimated seat belt usage for vehicles driving above 50 stood at 90.7% (C.I. 89.4% to 91.9%). As vehicles travel in lower speed limit areas, seat-belt usage declined. Occupants driving *31-50 mph* wore seat belts 86.7% of the time, (C.I. 84.5% to 88.8%), followed by the vehicles traveling *0-30 mph* with a rate of 84.2% (C.I. 81.8% to 86.6%).

The usage rates remained fairly constant across the three-speed ranges compared to last year’s scores. The *0-30 mph* category improved by .1 for a .11% increase. The *31-50 mph* category dropped by .1, a percentage drop of .12%, and the seat belt rate in the *Greater than 50 mph* category increased by .7 for a 7.7% increase.

Table 6.0
Statewide Seat-belt Usage by Vehicle Speed

	# of Sites	Estimate %	Std Error	CV %	Lower 95% Limit	Upper 95% Limit
<i>0-30 mph</i>	214	84.2	1.2	1.46	81.8	86.6
<i>31-50 mph</i>	241	86.7	1.1	1.28	84.5	88.8
<i>> than 50 mph</i>	289	90.7	0.6	0.70	89.4	91.9

Seat-belt Usage and Road Class

In this study, we also analyzed the seat belt usage rate based on Road Class. We have three different road classes of interest: *Primary*, *Secondary*, and *Local*. *Primary roads* typically have more lanes and higher speeds are allowed. *Secondary roads* fall between *Primary* and *Local roads* according to speed, access and number of lanes. Finally, *Local roads* are neighborhood streets used for short trips and involve lower speeds.

Table 7.0 below presents the seat-belt usage rate based on these three *Road Classes*. The seat-belt usage rate is the highest on *primary roads* followed by *secondary* and *local roads*. This difference may be associated with the differences in speeds associated with the three categories. As discussed in Table 6.0 above, drivers/passengers are more likely to wear a seat belt when moving at higher speeds. One primary difference in these three road classes is the posted speed limits, *primary* being the highest allowed speed, followed by *secondary* and *local roads* respectively.

Seat-belt usage on *primary roads* did not change from the rate in 2021; both standing at 92.6%, although the confidence interval did tighten up a bit. In 2021 the C.I. stood at (90.7% to 94.4%) while the confidence interval for 2022 stands at (91.2% to 94.1%). This tighter confidence interval gives us more precision to know the exact amount of drivers/passengers using their seat belts. *Secondary roads* demonstrated a significant increase in seat belt usage since 2021. This year's rate of 88.5% is an increase of 3% for a percentage increase of 3.5% $((88.5-85)/85)$. The *local roads* found a small decrease in seat belt use since 2021, as it dropped from 86.4% to 85.6%, .8 or a percentage decrease of .9%.

Table 7.0
Statewide Seat-belt Usage by Road Class

	# of Sites	Estimate %	Std Error	CV %	Lower 95% Limit	Upper 95% Limit
Primary	89	92.6	0.8	0.81	91.2	94.1
Secondary	398	88.5	0.5	0.53	87.6	89.4
Local	257	85.6	0.9	1.05	83.9	87.4

Seat-belt Usage by County

Table 8.0 illustrates the seat belt estimates by Colorado Counties. This table is organized from highest to lowest percentage. (Note: Appendix 1 presents this same table with the counties in alphabetical order). In this year’s study, eleven counties exhibited a usage rate above 90%. In 2021, only nine counties were at 90% or above. Further, two years ago in 2020, only six counties were above 90%. Consequently, in the past three years, a significant number of counties have increased their usage rate to a 90% threshold. We find twelve counties between 80% and 90%, and only three counties below the 80% range. The three counties that stand below the 80% mark are Fremont, Chaffee, and Pueblo.

**Table 8.0
Statewide Seat-belt Usage by County**

	# of Sites	Estimate %	Std Error	CV %	Lower 95% Limit	Upper 95% Limit
GRAND	12	96.3	0.8	0.87	94.7	97.9

PUEBLO	48	67.6	2.7	3.99	62.3	72.9

County Comparison of Top Ten versus Bottom Ten Counties

Table 9.0 below further evaluates the usage rate by counties. The table lists the top ten and bottom ten counties by seat-belt usage, as well as the county population and population per square mile. Conventional wisdom suggests that less populated areas are less likely to wear seat belts. The data in this table supports this argument.

While the average population of the top ten counties is smaller than the average population of the bottom ten counties, (AVG population of Top ten counties = 202,831, AVG population of bottom ten counties = 229,734), we must also consider the population per square mile. The bottom ten counties tend to be much larger in square miles. The bottom ten counties have an average of 169 more square miles per county than the top ten counties. The average population of the top ten counties per square mile stands at 601 while the population per square mile of the bottom ten counties stands at 177. Hence, the rural nature of the bottom ten counties may be leading to a lower seat belt usage rate.

County Comparisons of Top Ten and Bottom Ten Counties

Table 9.0
County Comparisons by Population Size

Ranking	County	Usage Rate	Population	County Size (Square miles)	Population per Square Mile
Highest Rated Counties by Seat-belt Usage

		Avg Usage rate 81.11%	Average Population 229,724		AVG Pop / Square Mile 177

CONCLUSIONS

Atélior, LLC conducted the 2022 Statewide seat belt study between June 12th and 25th. Earlier this year, a reselection of counties was conducted. This process is completed every five years. For the next five years, 26 counties will be observed across 744 statewide sites. This report detailed the findings of this investigation.

The observers surveyed 99,476 vehicles and 120,758 occupants, both drivers and front-seat passengers. The observers were unable to determine seat belt usage on a total of 3,125 occupants which represents 2.6% of the total vehicle occupants.

The results across the five vehicle categories were fairly consistent with recent studies. **Cars** showed a seat belt usage rate of 87.6% a .6 increase since 2021. Since 2013, seat belt usage in **Cars** increased by 5.0 which represents a 6% increase over that time period. **Vans** scored an 89.0% seat belt usage rate which was .9 better than found in 2021. This one-year improvement is a 1% increase. **SUVs**, which demonstrated a 90.3% rate improved by 4.4 points or 5%. **Commercial Vehicles** scored a 79.2% which is a 3.0 improvement and represents a 3.9% increase. **Trucks** is the sole category that dropped since 2021. In 2022, **Trucks** scored a 78.5% usage rate, while it earned an 88.1% in 2021. The 78.5% appears to be more in line with what **Trucks** have earned historically. The Premobilization rate was 80.5% and **Trucks** earned a five-year moving average of 81.5%. Hence, the 2021 rate for **Trucks** may be an anomaly. The overall seat belt usage rate improved slightly since the premobilization study in May of this year. The rate across all five vehicle categories stands at 87.0% with the premobilization rate of 86.4%. (Eleven of the 744 Statewide sites produced zero observations).

The five vehicle categories show significant improvements since 2013. The overall rate of 87.0% in 2022 compares nicely with the rate of 82.1% in 2013. Overall, the five categories improved 5.97% since 2013. The largest improvement is found in **Commercial Vehicles**, which improved to 79.2% from 65.5% in 2013. This represents a 21.0% $((79.2-65.5)/65.5)$ increase for the category.

Seat belt usage rates appear to be related to the speed of the roadway. The highest rate of usage is found when vehicles are driving on roadways with posted signage of *>50 mph*, standing at 90.7%. This is followed by roadways with posted speeds of *31-50 mph* scoring a rate of 86.7% and finally roadways at *0-30 mph* with a rate of 84.2. The speed issue appears to be related to the type of roadway as well. **Primary roads**, which have more lanes and higher speeds scored a rate of 92.6%, followed by **Secondary roads** at 88.5%, and **Local roads**, which are neighborhood streets with slower speeds, scored, an 85.6%.

Of the counties observed, eleven counties scored a rate above 90.0%. This is an improvement of 2 counties since 2021 and an improvement of 5 counties since 2020. This statistic needs to be further analyzed as there are new counties included in this year's study. Five of seven counties included in both 2021 and 2022 scored above 90.0% in both years (Garfield, Arapahoe, Denver, Boulder, and Morgan). Two counties included in both years were close to the 90.0% benchmark but fell just beneath the mark (Montrose at 87.8% and Douglas at 87.2%).

An evaluation among the top ten and bottom ten counties on usage rate demonstrates the more densely populated areas are more likely to wear their seat belts. The top ten counties scored a usage rate of 93.32% and have a population per square mile of 601, while the bottom ten counties average a usage rate of 81.11% but only have a population of 177 per square mile.

Overall, the 2022 statewide seat belt study demonstrates consistent results with recent years. The 87% rate is the second highest rate observed since 2013, (highest rate of 88.3% found in 2019). The three categories of **Cars**, **SUVs** and **Vans** hover around 90% with the last two categories of **Trucks** and **Commercial Vehicles** staying around the 80% mark.

Appendix 1

Statewide Seat-belt Usage by Counties in Alphabetical order

	# of Sites	Estimate %	Std Error	CV %	Lower 95% Limit	Upper 95% Limit

Appendix 5
Training Syllabus

Welcome and distribution of equipment
Survey overview
Data collection techniques

- Definitions of belt/booster seat use, passenger vehicles
- Observation protocol
 - Weekday/weekend/rush hour/non-rush hour
- Weather conditions
- Duration at each site

Scheduling and rescheduling

- Site Assignment Sheet
- Daylight
 - Temporary impediments such as weather
 - Permanent impediments at data collection sites

Site locations

- Locating assigned sites
 - Interstate ramps and surface streets
 - Direction of travel/number of observed lanes
- Non-intersection requirement
- Alternate site selection

Data collection forms

- Cover sheet
- Recording observations
- Recording alternate site information

Assembling forms for shipment
Safety and security
Timesheet and expense reports
Field practice at ramps and surface streets

Appendix 6

Appendix 7

Codes for Road Segment File

S1100	Primary Road	Primary roads are generally divided, limited-access highways within the interstate highway system or under state management, and are distinguished by the presence of interchanges. These highways are accessible by ramps and may include some toll highways.
S1200	Secondary Road	Secondary roads are main arteries, usually in the U.S. Highway, State Highway or County Highway system. These roads have one or more lanes of traffic in each direction, may or may not be divided, and usually have at-grade intersections with many other roads and driveways. They often have both a local name and a route number.
S1400	Local Neighborhood Road, Rural Road, City Street	These are generally paved non-arterial streets, roads, or byways that usually have a single lane of traffic in each direction. Roads in this feature class may be privately or publicly maintained. Scenic park roads would be included in this feature class, as would (depending on the region of the country) some unpaved roads.
